

Banknote & Coinzy analytics — tabs, formulas, events

Product dashboard for Banknote and Coinzy. Paste this file into Google Docs (**File** → **Open** or select all → copy → paste) so comments can sit on each section. Last updated 28 Aug 2026.

How to comment: Open in Google Docs, then comment on the numbered rows (5.1, 5.5, 5.6, 5.8, 5.9) or on any tab table below. Event names are the Firebase names after stripping `_android` / `_ios`.

Aayushya comments — what we changed

#	Comment	Status	What the dashboard does now
5.1	Same-day scan should be checked against <code>first_open</code>	Already correct	Tab 2. Install → first scan . Rate = devices with <code>identification_done_success</code> that calendar day ÷ devices with <code>first_open</code> that calendar day. Join is <code>user_pseudo_id</code> only (same device, same day). Not vs DAU. Not vs <code>user_id</code> .
5.5	Onboarding subs page — discount and non-discount? Also pack click, CTA, drop-off before payment	Done	Impression bucket (KPI 5) includes in-app screens: <code>Subs_page</code> , <code>Subs_page_discount</code> , <code>Subscription_screen</code> . Funnels → Paywall (unique people): shown → pack click → CTA (<code>subs_button</code>) → Banknote Google sheet (<code>subs_native</code>) → confirm. Pack mix table = unique people per <code>pack_name</code> × discounted / non-discounted. Funnels → Onboarding → subs : only people who saw onboarding; confirm = subscription taken from that group. Coinzy pages <code>subs_page_onboarding_1/2/3</code> + skip.
5.6	D1 and D7 must be different. Also create D4–D7	Done	Tab 6 now has four separate charts (not one mixed series): D1 = opened the app on install day + 1. D4 = opened on install day + 4. D7 = opened on install day + 7. D4–D7 = opened on at least one of days 4, 5, 6, or 7. Cohort is always <code>first_open</code> . Return = any Firebase event that day.
5.8	Not only success/(success+failure). Need scan attempted, permission, photo 1/2, submit, 5 results, details, add to collection	Done — two different tabs	Tab 3 Identify success stays quality-only: success events ÷ (success + failure events). That is AI / photo quality, not the funnel. Funnels → Identify is the step path. Core steps now include: entry → camera → permission → photo 1 → photo 2 → scan attempted → submit → success → top 5 results → details → add to collection.

#	Comment	Status	What the dashboard does now
5.9	Catalogue mixed collection and global catalogue	Fixed	Tab 9 is now two rates, not a union. Chart 1 = private collection (Collection_screen / collection nav). Chart 2 = global catalogue (Global_catalogue_screen). Step drop-off: Funnels → Private collection and Funnels → Global catalogue. Do not use Catalogue (all) as the KPI.

How to read a number

- **Events** = how many times it fired. One person can count many times.
- **Users** = distinct people that day. Funnel steps are user counts, not ordered sessions.
- If a later step has more people than an earlier step, they joined from another entry (or a missing event).
- Banknote and Coinzy are never mixed in one query.

MVP KPIs (10)

1. DAU (opened the app)

Formula: distinct users with an open/session that day.

Counts	session_start · App_open · first_open
Does not count	Notification display / receive / interact

2. Install → first scan (comment 5.1)

Formula: same-day successful ID ÷ first_open devices.

Install (denominator)	first_open on that calendar day, distinct user_pseudo_id
Same-day scan (numerator)	That same device also fired identification_done_success the same day
Join	user_pseudo_id only — empty user_id is ignored
Does not count	Scan on day 2+. Open without first_open

3. Identify success (quality)

Formula: success events ÷ (success + failure events). Not unique users.

	Banknote	Coinzy
Success	identification_done_success	same
Failure	identification_done_failure	+ Identification_failed

This is *not* the Identify funnel. See tab 8 and Funnels → Identify for the step path (comment 5.8).

4. Quota hit

Formula: users who hit scan quota ÷ users who attempted a scan. Not collection limit.

	Banknote	Coinzy
Quota	identiifcation_limit_exceeded	Identified_limit_reached · free_scan_*
Attempt	success + failure	success + failure + Identification_failed

5. Paywall → purchase (comment 5.5)

KPI formula (event counts): confirm events ÷ in-app paywall-shown events.

Step	Banknote	Coinzy
Paywall shown	Subs_page · Subs_page_discount · Subscription_screen	
Pack click	Subs_pack (params: pack name, discounted/non-discounted)	subs_pack · subs_pack_discount
CTA	subs_button	subs_button (home banner subs_discount_banner is a side row)
Native billing	subs_native	—
Confirm	Subs_confirm	subs_confirm · subs_confirm_discount · paid_purchase · trial_purchase
Cancel / fail	Subs_cancel · Subs_fail	subs_cancel · subs_fail

Unique people and pack mix live on **Funnels** → **Paywall**. Onboarding → subscription is **Funnels** → **Onboarding** → **subs** (only people who saw onboarding; Coinzy subs_page_onboarding_1/2/3 + skip). KPI 5 will not match the funnel because KPI 5 is event counts.

6. D1 / D4 / D7 retention (comment 5.6)

Cohort = first_open. Returned = any event on that offset day.

Metric	Meaning
D1	Came back tomorrow (day + 1 only)
D4	Came back on day + 4 only
D7	Came back on day + 7 only
D4–D7	Came back on at least one of days 4, 5, 6, 7

D1 and D7 are different charts. Empty recent days on D7 are normal (installs not a week old).

7. Scans / user

Average / person = successful IDs ÷ DAU (includes people who did not scan).

P10 / P25 / P50 / P75 / P95 / P99 = successful IDs among people who scanned that day.

Event: identification_done_success.

8. Identify funnel rate (comment 5.8)

KPI formula: distinct success users ÷ distinct Identify-open users, same day.

Open events: Identify_bottom_nav ∪ Identify_home (camera screen is not “open”).

The **step-by-step path** is Funnels → Identify (table below). Do not use tab 3 for that.

9. Collection vs global catalogue (comment 5.9)

Two rates of DAU. They are **not** mixed.

Chart	Banknote	Coinzy
Private collection	Collection_screen · private_collection_bottom_nav	Collection_screen · collection_bottom_nav
Global catalogue	Global_catalogue_screen · Global_catalogue	

10. Marketplace

Formula: marketplace users ÷ DAU. Feed is not mixed in.

Events: marketplace_screen · Marketplace_bottom_nav / marketplace_bottom_nav · market_item_explore.

Funnels — step events

Each row = distinct users who fired that step's events (not ordered sessions).

Identify (all) · Scan · bottom nav · Scan · home / banner

Same steps. Entry differs: all = nav ∪ home; nav-only; home-only.

Core step	Events
Identify entry	Identify_bottom_nav · Identify_home
Camera / photo screen	Identification_screen · photo_screen
Camera permission	Camera_permission_popup (granted / denied are side rows)
First image	photo_clicked_1 ∪ photo_uploaded_1
Second image	photo_clicked_2 ∪ photo_uploaded_2

Scan attempted	Banknote: Identification_attempted · Identification_done · Coinzy: Identification_attempted
Submit	photo_submit_button · photos_submitted (Coinzy also Identification_done)
Success	identification_done_success
Top 5 results	identification_top5_matches
Details opened	Banknote identification_details_screen · banknote_details_identification · Coinzy Coin_details_identification
Added to collection	Added_to_collection_identified · Added_to_collection_owned

Side / drop rows (not “success”): crop, quota block, failure, view all options, option chosen.

Private collection

Step	Banknote	Coinzy
Nav	private_collection_bottom_nav	collection_bottom_nav
Screen	Collection_screen	same
Card	Collection_clicked	same
Sub-collection	Sub_collection_Screen	same
Details	banknote_details_collection	Coin_details_collection

Global catalogue

Global_catalogue → Global_catalogue_screen → global_catalogue_item → banknote_details_global / Coin_details_global

Paywall

In-app only. Core: shown → pack → CTA → (Banknote: subs_native) → confirm. Pack mix = unique people per pack name × discount flag.

Onboarding → subscription

Cohort = people who saw onboarding. Pack / CTA / confirm only count that group. Coinzy also shows pages 1/2/3 and skip.

Marketplace · Feed · Expert (Coinzy)

Tab	Path
Marketplace	nav → marketplace_screen → market_item_explore → sale_Details_screen → market_contact
Feed	nav → Feed_screen → like/comment → feed_add

Expert	expert_evaluation_landing → upload → continue → queued → expert_evaluation_report
--------	---

Compare Apps · Health report · Explorer

Surface	What it uses
Compare Apps	Same daily signals as the MVP KPIs (one query per app). Scans / user-day is a decimal (e.g. 0.32), not rounded to 0.
Health report	Same signals + Identify leak + same-day first scan + paywall funnel + Coinzy Expert
Explorer DAU	Same as MVP 1
Unique vs repeat	Any event — new vs returning, one-day vs 2+ days
Installs + time used	first_open devices; “went in” = ≥10 seconds same day
Scan limits	Free vs subscribed quota (success cap vs fail cap)
D1 / D7 Explorer	Same definitions as MVP 6 (D1 and D7 are separate pages there)
Cohort LTV	Install = first_open. Revenue = store in_app_purchase / purchase USD — not Subs_confirm
Event inventory	Pick any event — hits + unique users. Use this to prove an event fires.

Do not mix these up

Looks similar	What we actually use
Identify “open”	Nav u home — not Identification_screen
Tab 3 vs Identify funnel	Tab 3 = quality rate. Funnel = step path including permission, photos, results, details, add
Collection vs catalogue	Separate rates and separate funnel tabs
Marketplace KPI	Market only — not Feed
Scan quota	Scan limit events — not Collection_limit_Reached
Coinzy confirm	subs_confirm — not Banknote’s Subs_confirm
Same-day first ID	vs first_open on user_pseudo_id only
LTV revenue	Store purchase events — not paywall confirm

Live dashboard: MVP tabs 1–10 and Funnels in the sidebar. SQL lives under `sql/dashboard/`. Funnel step lists live in `funnel-registry.js`.
